## 2.1 Types of drawing

2.1.1 Look at three representations of a house. Name the types of drawing. Then read the text and check your answers.

## 2.1 Types of drawing

There are many ways of putting a 3D object into 2D. **Orthographic** projections can be found on all construction projects. These drawings show different views of the object, and can include **elevations** (a view from one side) and **cross-sections** (the view when you cut through an object). Another type of drawing shows **exploded** views, which are very useful for understanding the assembly of an object, in other words how it all fits together. A third type of drawing is the **plan view**, which allows us to see an object from above. A typical example of this is a floor plan. These are very useful when we want to look at the fittings in detail, in other words where objects like cookers and baths go.

## 2.1 Types of drawing

### 1.2.3 Prints *Read the email from an architect to a contractor. Then, choose the correct answers*

I wanted to update you on my progress on the prints for the Gibson building.

I completed the **orthographic projection** of the building's exterior. This includes a **plan view** of the roof and **elevations** of all sides. I also completed **section** views of several interior walls.

This will let you easily see where plumbing and other fixtures should be installed. The prints of the building's interior sections are not yet finished. I have completed **isometric drawings** of several rooms. These prints produce three dimensional images because lines are drawn at thirty degree angles instead of **horizontally**. Unfortunately I am having trouble drawing some of the **irregular** wall features, such as moldings. The best way to show these is in **oblique drawings**. They have the most **complex** surface flat against the paper.

This is a time-consuming process, but I am working as quickly as I can. For additional detail, I am also including some **cross sections** of these surfaces. For your reference, these will be **vertically** oriented.

I attached a rough **sketch** of the building layout. Please look it over and let me know if you have any questions or concerns.

Thanks!

## 2.1 Types of drawing

### 1.2.3 Prints

#### 1. What is the purpose of the email?

- A. to correct an error in the building prints
- B. to list what types of prints need to be created
- C. to explain why orthographic projections are not needed
- D. to inform the contractor of what prints are complete and incomplete

#### 2. Which of the drawings are NOT finished?

- A. plan views
- C. oblique drawings
- B. section views
- D. building layout sketch

#### 3. Why is the architect struggling with some drawings?

- A. Several surfaces have been redesigned
- B. Some wall lealures have complex surfaces
- C. He has to show where plumbing fixtures are installed
- D. He does not have accurate elevation measurements

<b>2.2 Drawing and line</b>		
<b>2.2.1 Read the textbook entry on construction drawings. Then, choose the correct answers</b>		
<p>Every construction worker must know how to read a <b>scale drawing</b>. These illustrations show the layout for a construction project in an accurate <b>scale</b>. Construction drawings are made using an <b>architect's scale</b>, which often has two scales on one face. You may not be required to use this instrument. However, you should recognize the multiple types of lines that drafters make on drawings. The most basic line is the <b>object lined</b>. It is a heavy, solid line that shows the shape of an object.</p> <p>If the side of an object would not normally be seen a dashed line called a hidden line represents it.</p> <p><b>Extension lines</b> and <b>dimension lines</b> are thin, solid lines. They show the size of an object, such as it's length or width. A short extension line extends out from each side of the object. A dimension line connects the two extension lines, with the measurement written above it.</p>		
KHOA XÂY DỰNG <a href="http://khoaxaydung.duytan.edu.vn">http://khoaxaydung.duytan.edu.vn</a>	17	Dương Minh Châu Chaudmce@gmail.com

 ĐẠI HỌC DUY TÂN	Unit 2 Technical drawing	
<b>2.2 Drawing and line</b>		
<p>You will see a few other lines on drawings. A <b>centerline</b> with long and short dashes shows the center axis of an object. A thin line with an arrow called a <b>leader</b> labels objects and dimensions in tight spaces. A <b>cutting-plane line</b> shows where an imaginary cut was made to obtain a section-view drawing.</p>		
<b>1. What should every construction worker be able to do?</b>		
A. make scale drawings	B. use an architect s scale	
C. identify drafting line mistakes	D. recognize different kind of drafting lines	
<b>2. What does a hidden line show?</b>		
A. the shape of an object	B. the size of an object	
C. the middle point of objects	D. the unseen side of an object	
<b>3. Which of the following is NOT a solid line?</b>		
A. extension line	C. object line	
B. centerline	D. dimension line

**2.2 Drawing and line**

Match the words (1-5) with the definitions (A-E).

1. dimension line; 2. object line; 3. cutting-plane line; 4. hidden line; 5. leader

A. a line in a drawing that indicates where a section view is taken from and in what direction it is viewed

B. a line in a drawing that connects an object with its label

C. a line in a drawing that shows edges that are hidden from normal view

D. a line in a drawing that shows the size, such as length or width, of an object

E. a solid line in a drawing that shows the shape of an object

**2.2 Drawing and line**
**2.2.3 Fill in the blanks with the correct words and phrases**

scale; extension line; centerline; architect's scale; scale drawing

1. Use the \_\_\_\_\_ to complete the drawing.
2. A(n) \_\_\_\_\_ shows the middle of an object.
3. The print has a(n) \_\_\_\_\_ of 100 to 1.
4. The architect is still creating the \_\_\_\_\_.
5. This \_\_\_\_\_ connects to the dimension line to make the drawing clearer.

**2.2.4 Listen to a conversation between a student and an instructor. Mark the following statements as true (T) or false (F).**

1. The man is confused about two types of lines. \_\_\_\_\_
2. A cutting-plane line shows a center axis. \_\_\_\_\_
3. Cutting-plane lines are always solid. \_\_\_\_\_

 ĐẠI HỌC DUY TÂN	<b>Unit 2 Technical drawing</b>	
<p><b>2.2 Drawing and line</b></p> <p><b>2.2.5 Listen again and complete the conversation</b></p> <p><i>Student:</i> I'm having trouble understanding the (1) _____ some types of <i>drafting</i> lines.</p> <p><i>Instructor:</i> They can be tricky to (2) _____. Which ones are confusing you?</p> <p><i>Student:</i> A centerline and a (3) _____. Don't they both show the center of something?</p> <p><i>Instructor:</i> Not necessarily. You're right that a centerline shows the (4) _____ of something?</p> <p><i>Student:</i> Okay. But doesn't a cutting-plane line show (5) _____?</p> <p><i>Instructor:</i> No, It shows where the cut for a (6) _____ is. That doesn't have to be in the middle of the object.</p> <p><i>Student:</i> Oh. I see. It doesn't have to divide the object in half.</p> <p><i>Instructor:</i> That's right. You can also tell them apart by how they look.</p> <p><i>Student:</i> A cutting-plane line is usually solid, right?</p> <p><i>Instructor:</i> It can be either solid or dashed. And a centerline has long and short dashes.</p>

Unit 3 Basic math, numbers and shapes

---

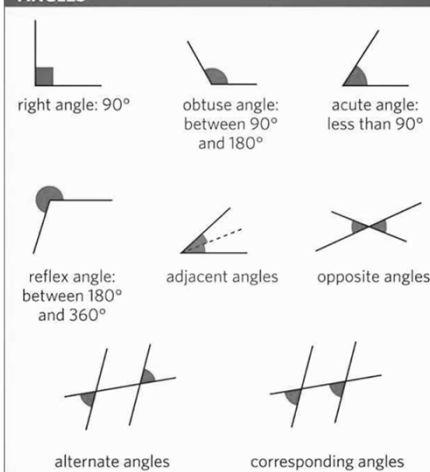

### 3.1 Basic math

#### 3.1.1 Read the email about the cost of materials. Then, mark the statements as true (T) or false (F).

Charles.

You asked why the order was so expensive.

We need about two and a half bags of concrete for each structure. I **rounded up** to three bags per structure. There are ten structures. When you multiply that, it equals thirty bags. That part of the order was \$150. The cost of concrete **plus** the cost of rebar **came** to over \$600. When you add shipping costs, it totals \$650.

I can **subtract** a few items to save money. The total **minus** the cost of rebar is around \$175. Or, we can make several payments. The bill **divided by** three payments is about \$215. We could pay the remainder with the last payment Let me know what you prefer.

Barbara.

 <b>DAI HOC DUY TAN</b>	<b>Unit 3 Basic math, numbers and shapes</b>	
<b>3.2 Decimals, fractions, and percents</b>		
3.2.1 Read the guide about converting fractions, decimals, and percents.		
1. <b>Reducing</b> Fractions: Divide the <b>numerator</b> and <b>denominator</b> by the same number. Repeat if necessary until both cannot be divided into whole numbers.		
2. <b>Percentages:</b> A <b>percent</b> is a fraction. Its denominator is 100. So 71% is equal to 71/100. In decimal form, this is 0.71.		
It is usually easier to do calculations with decimals instead of fractions. Convert measurements that are fractions to decimal form.		
3. <b>Convert</b> a fraction to a decimal: Divide the numerator by the denominator.		
4. Convert a <b>mixed number</b> to a decimal: First, write the whole number. Place a decimal point to its right. Change the fraction to a decimal (see above). Then write it to the right of the decimal point.

<p>According to the Guinness Book of Records the tallest man in the world is Vimal Singh, who is 2.72 m tall, and the shortest man is Younis Edwan, who is only 0.65 m. The heaviest man in the world is Morgan Reid with a weight of 635 kg, and the heaviest woman is Avinash Persaud, who weighs 725 kg. The oldest person in the world was Jeanne Calment, who died when she was 122 years and 164 days old. The oldest living person in the world is a Japanese woman, who is 114+ (as of February 2010). She was born on 10 May 1895.</p> <p>As for structures, the tallest structures are dozens of radio and television broadcasting towers that are around 600 m. The three tallest buildings in the world are the 828 m tall Burj Khalifa in Dubai, the United Arab Emirates, the Taipei 101 in Taiwan, which is 509 m tall, and the Petronas Towers in Kuala Lumpur, Malaysia at 452 m.</p>

 <b>DAI HỌC DUY TÂN</b>	<b>Unit 3 Basic math, numbers and shapes</b>	
<b>3.4 Shapes and dimensions</b>		
<p>Mathematics and descriptive geometry are an integral part of civil engineering studies. Designers draw shapes and patterns to create a project; other civil engineering specialists calculate the correct proportions of the designed structure.</p>		
<p>There are various shapes of lines, two-dimensional (2D) figures and three-dimensional (3D) figures.</p>		
<p>Lines: straight, curved, bent, horizontal, vertical, parallel, tapering, perpendicular.</p>		
<p>2D figures: square, rectangle, triangle, circle, semi-circle, pentagon, hexagon, octagon, trapezoid, trapezium, rhombus.</p>		
<p>3D figures: cube, prism, sphere, hemisphere, pyramid, cone, cylinder.</p>		
<p>A rectangle is a two-dimensional figure with two opposite sides that are parallel and the adjacent ones are perpendicular. A rectangle has four right angles. Something with the shape of a rectangle is rectangular, e.g., a long rectangular table. If we want to calculate the perimeter or area of a rectangle, we need to know how long and how wide the sides are. If we have the length and width of the rectangle, we can start calculating.</p>		
<b>KHOA XÂY DỰNG</b> <a href="http://khoaxaydung.duytan.edu.vn">http://khoaxaydung.duytan.edu.vn</a>	<b>43</b>	<b>Dương Minh Châu</b> <b>Chaudmce@gmail.com</b>

 <b>DAI HỌC DUY TÂN</b>	<b>Unit 3 Basic math, numbers and shapes</b>	
<b>3.4 Shapes and dimensions</b>		
<p>A circle is a round shape consisting of a curved line that completely encloses a space and is the same distance from the centre at every point. Something in the shape of a circle is circular. A circle is cut in half by its diameter. Its two halves can be called semi-circles. The radius of a circle is the distance from its centre to the circumference.</p>		
<p>A cube is an object like a box with six square sides that are all the same size. Cubic units are used for measuring volume. A sphere is a round object like a ball. A cube and sphere are both three-dimensional objects.</p>		
<p>A cylinder is a three-dimensional object. Its cross-section is circular in shape, and its longitudinal section is rectangular in shape. In other words the cross-section of a cylinder is shaped like a circle, and the longitudinal section is shaped like a rectangle. The cross-section of a cone is also circular in shape, but the longitudinal section is shaped like a triangle.</p>
